

Eric - Level 2 Virtual

Have you ever wondered about polar bears? One of the facts is that talking about the High Arctic and the Low Arctic is so interesting because it provides a lot of details and a map to help readers understand. Another interesting fact is how polar bears walk on thin ice, and it sounds interesting because it sounds intense.

My top 3 facts are: The first one is color-changing; it is usually for snow rabbits or snow foxes. I think it is interesting because it is like octopus but in the freezing cold. Second, it is the midnight sun because it is very interesting for the way the sun is up at midnight. My favorite is the Northern Lights. It is interesting because of how the lights shine in the middle of the freezing land and the energy particles shine.

Another one that might be interesting is the polar bear cub. It's because it's very interesting how the cubs grow from a useless and helpless animal to a strong, tough polar bear. The one that's probably the weirdest and most interesting at the same time is the myths the Arctic people talk about. It's weird because it's not real about a fake person or a fake goddess, but about people who like to spread a weird myth to the world. It's also interesting because it tells what it lives and where it lives. And it's fun to learn.

The weirdest and most interesting was when zookeepers and scientists found out that algae make the bear green. In 2004, in a zoo in Singapore, a zookeeper saw a polar bear that was green. He found out about algae, which is a green, teeny, tiny plant that grows in damp and hot places. The polar bear's name was Sheba, and Inuka looked white again. The real story is interesting because the algae got onto Sheba and Inuka's fur, which made them look green, and when the algae fell off, it looked white again.

In conclusion, the facts were very interesting. In my opinion, the facts were detailed and noticeable. The main opinion is that the facts were very wondrous and had good details, and it was fun.
